pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

to treat hemophilia, comprises at least a portion of Factor VIII operably linked to control sequence -
```

Example 9; Fig 6; 92pp; English

The present DNA sequence is a recombinant adenovirus-associated vector, C (rAAV) construct pVmA.lcP8deltaB. This expression vector comprises the promoter, first intron (-573 to +985) of human elongation factor-lalpha C (EFlalpha) gene, human Factor VIII coding sequence (hFVIII) and a C polyadenylation signal from human growth hormone (hGH). This sequence is first 57 bp encoding the 19 amino acid signal peptide, Al and A2 domains C and 5 amino acids from the N-terminus of the B domain. The light chain c segment comprises the heavy and light chain sequences into the same plasmid seperated by 42 nucleotides coding for 14 residues C of the B domain, that is deleted. This plasmid is operably linked to C control sequences, that directs the transcription and translation of the therapy to treat haemophilia. This method allows prolonged expression of therapy, because of their broad host range, safety profile and duration xx xx

The present invention relates to a method for treating a subject suffering from a blood clotting disorder. The method comprises administering a recombinant adeno-associated virion (rAAV) comprising a nucleotide sequence encoding the light chain of factor VIII and a second recombinant adeno-associated virion comprising a nucleotide sequence encoding the heavy chain of factor VIII. The rAAV vector is
                                                                                                              Claim 19; Fig 6; 90pp; English.
                                                                                                                                                  Treating blood clotting disorder, especially hemophilia in mammals, by administering recombinant adeno-associated vectors which express blood

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          particular humans. The rank vector provides high level and long term expression of biologically active-clotting factor VIII in vivo. expression of biologically active-clotting factor VIII in vivo. The present sequence is pund. 1cf8. B vector without the plasmid backbone. It comprises human elongation factor 1 (EF1) promoter, backbone in the human factor VIII coding sequence, a poly A signal B-domain deleted human factor VIII coding sequence. A poly A signal and AAV inverted terminal repeats (ITRs) at the ends. The vector encodes both the light and heavy chains of human factor VIII
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 4999 BP; 1375 A; 1151 C; 1155 G; 1318 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           g
                                hfvIII coding region comprises the heavy chain gene segment with the can and a main acid signal peptide, Al and A2 domains can are segment comprises the heavy and light chain gene segment comprises the C-terminal 85 amino acids of B domain. The light chain comprises the C-terminal 85 amino acids of B domain and the A3, compared to the same plasmid seperated by 42 nucleotides coding for 14 residues code the B domain, that is deleted. This plasmid is operably linked to control sequences, that directs the transcription and translation of the control sequences, that directs the transcription and translation of the control sequences, that directs the transcription and translation of the control sequences, that directs the transcription and translation of the control sequences, that directs the transcription and translation of the pay to treat haemophilia. This method allows prolonged expression of therapy to treat haemophilia. This method allows prolonged expression of therapy, because of their broad host range, safety profile and duration of expression in the infected hosts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    4840 tttgtgtgcggccgcaggaacccctagtgatggagttggccactccctctctgcgcgctc 4899

AAD08612
Sequence 11933 BP; 3258 A; 2818 C; 2717 G; 3140 T; 0 other;
                                  backbone. It comprises HF-3 mouse albumin promoter, a synthetic intron based on human elongation factor lalpha (EFlalpha) and immunoglobulin G (IGG) intron sequences, B-domain deleted human factor VIII coding sequence, poly A signal based on rabbit beta-globin sequence and AAV inverted terminal repeats (ITRs) at the ends. The vector encodes both the light and heavy chains of human factor VIII.
                                                                                                                                second recombinant adeno-associated virion comprising a nucleotide sequence encoding the heavy chain of factor VIII. The rAAV vector is particular humans. The rAAV vector provides high level and long term expression of biologically active clotting factor VIII in vivo.

The present sequence is pAAV-FB-1 vector without the plasmid
                                                                                                                                                                                                                                    administering a recombinant adeno-associated virion (rAAV) comprising a nucleotide sequence encoding the light chain of factor VIII and a
                                                                                                                                                                                                                                                                         The present invention relates to a method for treating a subject suffering from a blood clotting disorder. The method comprises
                                                                                                                                                                                                                                                                                                                                    Claim 18; Fig 5; 90pp; English.
                                                                                                                                                                                                                                                                                                                                                               Treating blood clotting disorder, especially hemophilia in mammals, by administering recombinant adeno-associated vectors which express blood coagulation factor {\tt VIII}
                                                                                                                                                                                                                                                                                                                                                                                                                                             WPI; 2001-417955/44.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   enhancer
                                                                                                                                                                                                                                                                  vector. The vector comprises a heterologous nucleotide sequence encoding B-domain deleted factor VIII operably linked with at least one enhancer and at least one promoter. The method results in the production of high titer rAAV vector stocks carrying the B-domain deleted factor VIII transgenes and expression cassettes, which generate adequate titers of virus for in vivo administration. The recombinant vectors are useful for treating haemophilia A, where the liver expresses the encoded B-domain deleted factor VIII, which is secreted into the blood. They are also useful for the treatment of other coagulation disorders. The present sequence encodes a B-domain deleted factor VIII.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        misc_feature

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              781 cctctactga 790
                                                                                                                                                                                                                                                                                          07-JUN-1995;
                                   This invention describes movel adenoviral vectors comprising at least one DNA sequence encoding a clotting factor (Factor IX or Factor VIII). The vectors of the invention have haemostatic activity. The vectors are useful for the treatment of hemophilia A or hemophilia B by gene therapy. This sequence represents human Factor VIII cDNA which has the B domain
                                                                                                                                                                                        Connelly S,

The synthetic gene was assembled PCR templates. Synthetic genes of the invention (see also AAV232B9 91) are used for production of recombinant proteins in the natural genes. They can also be used in gene therapy.

CC degradation by human complement and is capable of inducing long term CC degradation by human complement and is capable of inducing long term CC systemic expression of the therapeutic protein when administered CC intravenously to a human. The long term systemic expression results in a CC intravenously to a human. The long term systemic expression results in a CC of the human for a period of at least 30 days after the administration of CC therapeutic protein to treat, e.g. haemophilia A, haemophilia B, CC thrombosis, hypercoagulable disorders, liver diseases such as helassemia, phenylketonuria, Lesch Nyhan syndrome, CC disorders such as thalassemia, phenylketonuria, Lesch Nyhan syndrome, CC severe combined immunddefiatency (SCID), cystic fibrosis, Duchenne's severe combined immunddefiatency (SCID), cystic fibrosis, Duchenne's cCC miscular Dystrophy, inherited emphysema, familial hypercholesterolemia, CC diabetes, hypopituitarism, adenine deaminase deficiency, alphaicantification, high blood pressure, Allheimer's disease, autoimmune or CC inflammatory disease or graft versus host disease, autoimmune or Surviving inactivation in human serum thereby allowing efficient gene CC transfer over prolonged periods of time.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           factor VIII. This is used in the construction of recombinant retroviral vectors expressing human factor VIII. The invention provides the preparation of replication defective recombinant retrovirus (RRV)

pactor VIII, the SQN deletion does not influence the in vivo pharmacokinetics, but the reduced size of the molecule appears to decrease proteolytic degradation. The invention relates to preparations of replication defective recombinant retrovirus (RV) expressing a B domain-deleted human Factor VIII protein, where the recombinant RV is capable of infecting human cells, is resistant to degradation by human complement and is capable of inducing long-term (at least 30 days and up to 6 months or longer post-injection) systemic expression of Factor VIII when administered to a haemophilia A patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WO9800542-A2

                                                                                                                                            deletion mutant SQN (see AAW44372) of human Factor VIII. The SQN mutant is created by fusing Ser-743 to Gln-1638 of native Factor VIII (see AAW44373) to form a Ser-Gln-Asn (SQN) link between the A2 and A3 Factor VIII domains. When compared to plasmid-derived and A3 Factor VIII domains.

It was obtd. by PCR amplification (see also AAT69812-13) of the HCII acidic region from total liver cDNA, fusion to sequences encoding Factor VIII aa706-711 and aa737-743, and incorporation of the construct into plasmid pCLB-dB695. The hybrid protein, which can be expressed using gene therapy techniques, has increased procoagulant activity owing to the HCII acidic region, and can be used to treat blood coagulation disorders such as haemophilia A.

endothelial growth factor collagen I coated surface in culture medium comprising vascular Expanding population of endothelial cells useful to biocompatibilize implantable medical devices comprises contacting buffy coat cells with

Claim 19; Fig 3; 53pp; English.

RX
CC endothelial cells (EC) obtained for expanding the population of CC in contact with a collagen I coated surface, buffy coat cells obtained CC in contact with a collagen I coated surface, buffy coat cells obtained CC in contact with a collagen I coated surface, buffy coat cells obtained CC in containing vascular endothelial growth factor (VEGF) and free of bovine CC containing vascular endothelial growth factor (VEGF) and free of bovine CC into the blood stream of a mammal, so that an effective amount of CC pactor VIII protein is secreted in the blood stream of the mammal. CC This sequence represents a huamn factor VIII gene into which an CC enhanced green fluorescent protein coding sequence has been inserted. CC protein (eGFP); the last panino acids of the SQ linker peptide; an enhanced green fluorescent CC clomain and the hfVIII C2 domain. Transgenic EC transduced in vitro CC are useful for improving prosthetic implants. EC is also useful for cCC diagnosing clotting disorders where indication or disease is associated with a reduction in the activity of an enzyme. EC is also useful in gene CC deaminase deficiency, sickle cell anemia, thalassemia, hemophilia, CC transition boas frantitres and to transformer such as a cc contains the activity of an enzyme. EC is also useful for deaminase deficiency, sickle cell anemia, thalassemia, hemophilia, cc contains the protein contains the activity of an enzyme. EC is also useful for a contains the protein contains the activity of an enzyme. EC is also useful for a contains the protein contains the activity of an enzyme. EC is also useful for a contains the protein contains th repairing bone fractures and to treat or prevent osteoporosis.

Specifically provided are chimeric factor VIII sequence factor VIII. Specifically provided are chimeric factor VIII sequences comprising the Al. A2, A3, B, C1 and C2 human domains as set forth in AAQ66615, where the Al and/or A2 domains, as well as other segments, such as the regions corresp. to the AA numbers 336-372, 336-740, 372-740, 700-740 and combinations of these regions have been replaced in whole or in part with porcine factor VIII sequences as set forth in AAQ66616 and AAR55353.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          19-SEP-1996 (first entry)
                                                                                                                                                                                  (AAW00465), a trace plasma glycoprotein which acts as a cofactor in conjunction with Factor-TXA in the activation of Factor-TX. Retroviral vectors comprising the full-length cDNA can be efficiently packaged into infectious retroviral particles. These may be used to transduce cells either in vivo or ex vivo. Factor-VIII expressed from such transduced cells will be processed and transported in a fashion analagous to the expression product of a normal Factor-VIII gene. Retroviral particles harbouring such vectors will be useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    sig_peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 781
                                                                                                                                                                                                                                                                                                                                    Retroviral vector directing expression of full length factor VIII used in the gene therapy and treatment of haemophilia A
                                                                                                                                                                                                                                                                                                                                                                             P-PSDB; AAW00465.
